## INVENTS NEW METHOD FOR MAKING BRICKS

WILL SAVE BILLIONS -- Trybuna Ludu, No 291, 22 Oct 49

Engineer Stanislav Bartoszewicz, chief director of the Central Administration of the Building Materials Industry, has invented a new method for making bricks. Steam and/or water is used in treating the clay. Herstofore, after extraction, clay had to be lumped in the form of large prisms and stored for many months before processing. In the new method, steam is applied, rendering the clay immediately fit for use. The high temperature likewise facilitates the forming of bricks and increases the productivity of machines by 30 percent. The number of rejects, previously reaching 10 percent, has been reduced to a minimum. Baking time has also been substantially reduced.

The production increase achieved by the new method will amount to about 100 million bricks in 1950. To achieve the same production under the old method would require the construction of ten additional brickyards at a cost of 1,500,000,000 zlotys. Savings effected by eliminating the old storing methods represent over 100 million zlotys. It is also estimated that 700,000 dollars can now be saved in the purchase of new machines from abroad, required under the Six-Year Plan.

BUILDING MATERIALS INDUSTRY FULFILLS PLAN -- Rzeczpospolita, No 291, 22 Oct 49

The Central Administration of the Building Materials Industry announced that the annual plan had been met on 21 October. Production reached 280,706,800 zlotys in 1937 prices. Competitive work was mainly responsible for the achievement.
